ENGINEERING PLAYBOOK

Blueprint & Methodology

Report logic, model architecture, refresh setup and portfolio design decisions.

MODEL ARCHITECTURE

Three fact tables anchor the solution: sales orders, purchase orders, and inventory snapshots. Date, Product and Warehouse are conformed dimensions; Supplier and Customer remain process-specific. This creates a clean star-schema experience for drilling from enterprise KPIs into operational detail.

CORE DEFINITIONS

OTIF = orders delivered on-time and in-full. Revenue at Risk = revenue tied to orders that missed OTIF. Stockout position = product/warehouse snapshots below 60% of trailing 28-day demand. Excess inventory = units above 2.5× trailing 28-day demand.

DECISION LOGIC

Control Tower leads with exceptions. Inventory separates service risk from excess capital. Supplier analysis combines delay, quality and value. Fulfillment traces service failures into customer revenue exposure.

DATA & REFRESH

Synthetic but deterministic dataset covering 2024–2025. All CSV sources ship inside /data. After extracting the project, update the DataFolder parameter once, then refresh. This keeps the project portable and Git-friendly.

ENGINEERING CHOICES

Built as PBIP with PBIR and TMDL. Auto date/time disabled. Explicit Date dimension. Single-direction star-schema relationships. Dedicated _Measures table. Hidden technical keys. Measures grouped into Fulfillment, Inventory, Suppliers, Exceptions and KPI display measures.

PORTFOLIO UPGRADE

This version intentionally fixes the numeric-format problem found in the earlier build. Financial measures now preserve detail in tables while KPI cards use dedicated display measures for executive readability. The page system also adds stronger panel treatment and a more deliberate command-center palette.
